

## VECTEM Downhole Three-Component EM Tool

The three component downhole VECTEM V receiver probe is designed to be used in conjunction with the terraTEM. It is available in two different diameters (3.8cm and 4.2cm) depending upon customer requirements. The VECTEM V is connected to the terraTEM via a four core cable which provides power, communications, and signal monitoring.

The Z component follows the physical axis of the borehole and is equivalent to a standard axial probe. However X and Y components are orientated to provide cross-hole data; they complete an orthogonal set of axes perpendicular to the borehole (Z component). Automatic corrections for rotation are applied to all data, and transformed to U, V, and A axes, allowing for data to be plotted, providing profiles for anomaly recognition and interpretation. It measures probe rotation and tilt of each sounding. Probe temperature is also monitored.

The VECTEM V unit comes supplied with the probe, serial interface unit, a short test lead replacing an extended winch/cable assembly, a connector from interface to winch, and an operation manual on CD. Additional cables and winches are options which are available for purchase.
